The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CDD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or

```
codon, coding region, 5' or 3' intron-exon junction, intron or region cotion, coding region, 5' or 3' intron-exon junction, intron or region come with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II) 4 receptor, interleukin (II) 5- receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CCR tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s). For the coligonuclectides are useful for reducing or lung disease. The coligonuclectides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are useful for preventing or treating a respiratory or lung disease. The CC espiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with cC inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), cronic obstructive pulmonary disease (COPD), coligonucleotide of the bronchoconstriction. This sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CThe invention relates to oligonucleotides anti-sense to an initiation CC codon, coding region, 5' or 3' intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C Or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CTR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with CC inflammation or an inflammation, allergy, asthma, impeded respiration, CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), and a contrave vinities as conformer.                                                                                                                                                                                              Critical Control of the servention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region of a mucleic acid target comben from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PD24 A, PD24 B, DD24 C or PD24 D. The invention come or more nucleic acid target(s) or expressed product(s), for the conformal control of a registratory or lung disease. The cc prevention and/or treatment of a respiratory or lung disease. The cc provides are useful for reducing or inhibiting expression of a cc provide by DD24 B, PD24 B, PD24 C, or PD24 D. The oligonucleotides are cusful for preventing or treating a respiratory or lung disease. The cc useful for preventing or treating a respiratory or lung disease. The creptor(s), and/or asthma and/or lung allergies associated with receptor(s), and/or asthma and/or lung allergies associated with receptor(s), and/or asthma and/or lung allergies associated with cc is chosen from airway inflammatory disease. The respiratory or lung disease (COPD), chronic obstructive pulmonary disease (COPD), chronic obstructive pulmonary disease (COPD), thronic obstruction, transpiration or fine transpirator in missing inflammation, bronchitis, airway obstruction or fine transpirator.
                                                                   Matches

chosen from a gene encoding interleukin (IL) 4 receptor, interleukin (IL) crossen from a gene encoding interleukin (IL) 4 receptor, CR1, CR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CT tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention calso relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The C cligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, C CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, C CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, C C CR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, C C crasses b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The crespiratory or lung disease to add/or increased levels of, adenosine and/or levels of adenosine A C inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammator, allergy, asthma, impeded respiration, c cystic fibrosis (CP), chronic obstructive pulmonary disease (CPD),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension;

The invention also relates to a method of screening a candidate compound that binds tone or more nucleic acid target(s) or expressed product(s), for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human oligonucleotide #724.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-JUL-2004

The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammation, disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary disease (COPD),

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region complete with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PD84 A, PD84 B, DD84 C or PD84 D. The invention collection and/or treatment of a respiratory or lung disease. The collection and/or treatment of a respiratory or lung disease. The collisonucleotides are useful for reducing or inhibiting expression of a collisonucleotides are useful for receptor, interleukin-5 receptor, cCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, ctryptase b, PD84 A, PD84 B, PD84 C, or PD84 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The cceptor(s), and/or asthma and/or lung allergies associated with receptor(s), and/or asthma and/or lung allergies associated with crecaptor(s), and/or asthma and/or lung allergies associated with collection or an inflammatory disease. The respiratory or lung disease collection stomation, lung disease collection, constructive pulmonary disease (COPD), chronic obstructive pulmonary disease (COPD), collection of the properties of action or this accuracy or some pulmonary disease collection or inflammation, bronchitis, across syndrome, pulmonary collection or the properties of the collection or the pulmonary disease collection or the properties of the collection or the pulmonary disease collection or the properties of the collection or the pulmonary disease colle

The invention consent from and/or treatment of a respiratory or lung disease. The consent from and/or treatment of a respiratory or lung disease. The consent from and/or treatment of a respiratory or lung disease in consent from a respiratory or lung disease. The consent from preventing or treating a respiratory or lung disease. The consent from a find for preventing a respiratory or lung disease. The consent from a find for and/or lung allergies associated with hyper-responsiveness to inflammation or an inflammatory disease. The respiratory or lung disease is associated with hyper-responsiveness for inflammation or an inflammatory disease. The respiratory or lung disease is consent from a firm inflammation, allergy, asthma, impeded respiration, constitution in the consent from a constitutive pulmonary disease (CPPD), consider from a constitution of the constitutive pulmonary disease (CPPD).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2004-293804/27.

WWW. Social control of the control o

asthma.

The invention relates to oligonucleotides anti-sense to an initiation CC codon, coding region, 5' or 3' intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CTR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, DE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, DE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, DE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC tryptase b, DE5 B, DE5

RESULT 892
ADO45367
       CC The invention relates to oligonucleotides anti-sense to an initiation CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are cuseful for preventing or treating a respiratory or lung disease. The CC compliance of levels of, adenosine and/or levels of adenosine A CC craft and/or asthma and/or lung allergies associated with CC inflammation or an inflammatory disease. The respiratory or lung disease conforms from airway inflammation, allergy, asthma, impeded respiration, CC cystic fibrosis (CF), chronic obstructive pulmonary disease (CDPD), and control of the co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ន្តន្តន្តន
                                                                                                The invention relates to a method of designing primers for simultaneous camplification of target DNA fragments in a single multiplex polymerase contain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) comprises: (a) aligning a first primer and a second primer; and (b) contain four or more bases that are perfectly matching to the 3' end cos not contain seven or more bases that are perfectly matching to the 3' end cos not contain seven or more bases that are perfectly matching coscept one mismatch to the 3' end sequence of the first primer at its 3' end does not contain six or contain six or more bases that are perfectly matching coscept one mismatch to the 3' end sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain six or contain eleven or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer at its 3' end contain six or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching except cone mismatch to a sequence anywhere of the first primer or the second contain eleven or more bases that are perfectly matching enemals. The second contain eleven or more bases that are perfectly matching enemals and the first primer or the second contain eleven or more bases that are perfectly matching enemals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                            The invention relates to a compound targeted to a nucleic acid molecule encoding B7H, where the compound specifically hybridises with the nucleic acid molecule encoding B7H and inhibits the expression of B7H. The compound is useful for modulating the expression of B7H. It is also useful for diagnosing or treating diseases associated with expression of B7H, e.g., an autoimmune disease. The present sequence represents a human
                                                                                                                                                                                                                                                                                                                 New compound targeted to a nucleic acid molecule encoding B7H and inhibits expression of B7H, useful for modulating the expression or for diagnosing or treating, e.g. autoimmune disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel peptide comprising a TRG1-20 sequence capable of recognising and inducing the human leukocyte antigen (HLA)-B52 or HLA-B62 constraint property of a cytotoxic T-cell (CTL) or a peptide comprising a TRG2-41 sequence capable of recognising and inducing the HLA-B52 of a CTL. The peptide of the invention demonstrates cytostatic activity and may be useful for inducing a cytotoxic T-cell in order to treat cancer, preferably epithelial cancer, more preferably lung cancer, stomach cancer, colon cancer, prostatic cancer and/or melanoma. The treatment may comprise the use of a vaccine. The current sequence is that of the PCR primer 4 of the invention which was used to analyse human testin-related gene (TRG) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel tumor antigens TRG1-20 and TRG2-41 capable of recognizing inducing human leukocyte antigen B52 or B62 constraint property cytotoxic T lymphocyte, useful for treating cancer e.g., colon of the co

The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Ephrin-B2 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human Ephrin-B2 polypeptide of the
                                                                                                                                                                                                                                                                                                    Human; Ephrin-B2; ss; antisense oligonucleotide; phosphorothicate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cy

encoding the human Ephrin-B2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferable a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comporising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Ephrin-B2 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Ephrin-B2 DNA antisense oligonucleotide target region of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                osteoporosis;
```

The specification describes a method for assessing bone mineral density (BMD) in an individual. The method comprises using a chloride channel 7 (Clcn7) gene marker. The Clcn7 gene maps to chromosome 16p13 and comprises 25 exons. This polymorphic marker is a single nucleotide polymorphism (SNP)in position 14476 situated in intron 8, position 19233 situated in exon 15, position 19240 situated in exon 15, position 39699 situated in exon 1, or position 39705 situated in exon 1. The polymorphic marker may also be a tandem repeat marker which is the 50 bp repeat polymorphic marker which is in linkage disequilibrium with it. The method of the Claim Assessing bone mineral density (BMD) in an individual, useful for treating the individual to prevent or reduce the onset of osteoporosis, comprises using a chloride channel 7 (Clcn7) gene marker. 24; Page 25; 51pp; English.

The method is useful for assessing BMD, preferably lumbar spine BMD or femoral neck BMD. The method is useful for establishing a risk of (developing an) osteoporotic fracture. The method is also useful for manufacturing a means for assessing whether an individual has a predisposition to osteoporosis. Primers ADO71339-ADO71540 were used for mutation analysis and genotyping of SNPs in exon 15 of the Clcn7 gene.
                                                                                                                                               The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      breast cancer; cytostatic; gene therapy; GPG, GPIV; GPVI; chromosome 19q13.4; ss;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-NOV-2002; 2002US-0429136P.

                                                                                                                                                                                                                                                                     (AAT62346). The method involves ligating a double stranded DNA structure with a non-complementary region, a 'bubble', in the centre (e.g. see AAT62343-4), to restriction digested fragments of regions containing IRES. The ligation results in a double stranded DNA molecule containing at least one 'bubble' at either end. After denaturing the structure, amplification of the IRE-containing region proceeds by PCR using primers targeted to the IRE sequence (e.g. AAT62347-50) and to the sequence in the 'bubble' region (e.g. see AAT62345). The primer presented here binds to nucleotides 216-236 of the Alu-J polymorphic repeat sequence. The method can be used to detect the presence or absence of a chromosomal aberration e.g. in a genetic disorder, in a test organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bubble; interspersed repetitive element; ligation; annealing; PCR; polymerase chain reaction; amplification; chromosomal abs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amplification of nucleic acid having interspersed repetitive element - using bubble oligo:nucleotide.

                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                 S
   BXBXBX8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated or recombinant nucleic acid compensing an ANGE, CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLLD8, CLLD7, antiasthmatic, dermatological, antipyretic, and antiinflammatory. The nucleic acids of the invention may be used in gene therapy to treat disorders. The nucleic acid sequences are useful for screening agents that inhibit or enhance activity of an ANGE, CLLD8, or CLLD7 gene. The agent or antibody is useful for treating agents that inhibit or enhance activity of an ANGE, CLLD8, or CLLD7 gene. The agent or antibody is useful for treating assay detecting or measuring the polypoptide in the sample. The host cell is useful for producing, regulating and analyzing the polypoptide. The splice variant of ANGE, CLLD8, or CLLD7 is useful for producing the severity, or predisposition to a disease. This polynucleotide sequence represents an REN-34 SNP binding colling to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC Sequence comprising an ANGE, CLLD8 or CLLD7 mRNA, or ANGE-CLLD8, ANGE-CLLD8, CLLD7, CLLD8, or ANGE-CLLD8 CLLD8 or CLLD7 mRNA sequence, its CC complement, homologue or fragment. The novel nucleic acid sequences have the following activities: antiallergic, antiasthmatic, dermatological, CC antipyretic, and antiinflammatory. The nucleic acids of the invention may be used in gene therapy to treat disorders. The nucleic acid sequences care useful for screening agents that inhibit or enhance activity of an ANGE, CLLD8 or CLLD7 gene. The agent or antibody is useful for treating CC IgE-mediated diseases, such as asthma, atopy, hay fever, eczema, atopic cuseful in an assay detecting or measuring the polypeptide in the sample. CC Useful in an assay detecting or measuring the polypeptide in the sample. CC Olypeptide. The splice variant of ANGE, CLLD8, or CLLD7 is useful for CC diagnosing an IgE-mediated disease, atopy, a form of atopic disease or con-atopic asthma, or predicting the severity, or predisposition to a CC disease. This polynucleotide sequence represents an REN-34 SNP binding conjugation of the invention.
                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of designing primers for simultaneous camplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) comprises the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end cost and does not contain seven or more bases that are perfectly matching comprise of the first primer at its 3' end does not contain seven or more bases that are perfectly matching comprise or the second primer, the first primer or the second primer, the first primer or the second primer, the first primer or the second primer at its 3' end does not contain six or comprise that are perfectly matching to a sequence anywhere of the first primer at its 3' end does not contain eleven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer at its 3' end does not contain eleven or more bases that are perfectly matching except come mismatch to a sequence anywhere of the first primer or the second complification of target DNA fragments in a single multiplex polymerase contain reaction. It is also useful in the identification of multiple genes crelated to multifactorial diseases, the genome-scale detection of genetic polymorphisms in a large population, the gene expression contains in a large population, the gene expression contains in a single multiple genes or this sequence corresponds to an example of a primer of the invention.

                                                                                                                                                                                                                                                                                                             gene polymorphisms of drug-metabolising enzyme genes. The kit contains a polymerase chain reaction (PCR) buffer solution containing DNA polymerase and NTP, a normal forward primer, a mutated forward primer, a reverse primer and a fluorescence-labelling probe. The method involves carrying out PCR on sample DNA, containing a drug-metabolising enzyme gene, together with PCR buffer, the normal forward primer, the reverse primer and the fluorescence-labelling probe (step A); and carrying out PCR on the sample DNA together with PCR buffer, the mutated forward primer, the reverse primer and the fluorescence-labelling probe (step B), and a step of comparing the result of step a with that of step B). The present sequence is a primer for human CYP2C18i, which was used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  JP2001017185-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC Primers AAV06168-228 are used in a novel method for simultaneously CC determining the alleles present in short tandem repeat loci from one or CC more DNA samples. The DNA sample to be analysed has a set of at least CC consisting of D3S1539, D4S2368, D5S818, D7S820, D9S930, D10S1239, CC D13S17, D14S118, D14S548, D14S562, D16S490, D16S539, D16S753, D17S1298, CC D17S1299, D19S253, D2OS481, D2S2633, HUMCSF1DP, HUMFDAX, HUMFIO1, CC HUMFBSFPS, HUMF13A01, HUMBFXIII, HUMLIPOL and HUMWFDAX, Lander repeat loci the DNA sample to be analysed has a set of three short tandem repeat loci CC which can be amplified together, where the set of loci is selected from CC the DNA sample to be sets: (1) D3S139, D19S253, D13S17; (2) D10S1239, CC D9S930, D2OS481; (3) D10S1239, D4S3368, D2OS481; (3) D10S1239, D4S3317, The CC loci are co-amplified in a multiplex amplification reaction (MAR), where the product of the reaction is a mixture of amplified alleles from each CC of the co-amplified loci in the set. The amplified alleles in the mixture CC are evaluated to determine the alleles present at each of the loci analysed in the set within the DNA sample. The methods are used for the CC analysed in the set within the DNA sample. The methods are used for the CC detection of short tandem repeats as genetic markers for the development CC genes, and the simplification and precision of DNA typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

New method for analyzing e.g. human tissue DNA samples comprises coamplification of at least 13 short tandem repeat loci, useful in e.g. determining the parentage of a child.

Claim 9; Page 78; 90pp; English.

AAA47201-307 are oligonuclectide primers used to amplify human genomic CC DNA short tandem repeat (STR) loci. The claimed method comprises CC simultaneous determination of the alleles present in a set of loci from CC one or more DNA samples. In particular, at least thirteen loci of genomic CC DNA are amplified in a single multiplex reaction. At least one of the CC loci is preferably a STR locus with a repeat unit of five to seven bases CC or base pairs in length. Preferred loci are thirteen human STR loci CC chosen by the United States Federal Bureau of Investigation as core loci CC chosen by the United States Federal Bureau of Investigation as core loci CC chosen by the United States Federal Bureau of Investigation as core loci CC p381538, HOMTHO1, D21811, D18851, HOMWWFR31, D881179, HOMTPOX, HUMFIERA, CC D588189, D138317, D78820, D168539 and HUMCSB190. Some sets of loci compaining at least one DNA sample; (b) selecting a set of CC minimal incidence of artifacts, e.g. due to repeat slippage. The method CC comprises; (a) obtaining at least one DNA sample; (b) selecting a set of CC continual incidence of artifacts, e.g. due to repeat slippage. The method CC comprises; (a) obtaining at least one DNA sample; (b) selecting a set of CC continual incidence of artifacts, e.g. due to repeat slippage. The method CC comprises; (a) obtaining at least one DNA sample; (b) selecting a set of CC continual continual reaction, the product of the reaction comprising a mixture of amplified alleles from each of the co-amplified loci in the set in a cc continual continua samples found at a crime scene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The sequences given in AAQ25868-9 are nucleotide primers which are CC characterised by binding to a 5′ and a 3′ Alu terminus, respectively. CC These Alu primers were based on a current revision of consensus sequence CC of Alu repeats. This revision is based on nucleotide sequences of 50 CC different, cloned and sequenced human Alu segments. Two regions on the CC sequence showed a high degree of conservation and these were used as CC candidate regions for the primer locations. In order to minimize the CC incorporation of Alu sequence itself in the inter-Alu-PCR, the 5′ primer CC was designed to recognise a specific region and to direct DNA synthesis CC bound. The converse is true for the 3′ primer. Amplification using these CC two primers yields products ranging from a few hundred to several CC thousand base pairs. The primer design maximizes both the number of Alu Segments recruited and the number of inter-Alu unique sequences CC amplified. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               off the 5' end and away from the middle of the Alu segment to which it is bound. The converse is true for the 3' primer. Amplification using these two primers yields products ranging from a few hundred to several thousand base pairs. The primer design maximizes both the number of Alu segments recruited and the number of inter-Alu unique seguences amplified. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                           AAQ85677 standard; DNA; 19
                                                                                                                                                                                                                                                                                                                                                                       Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a PCR primer Alu-2 which specifically recognises human consensus sequences located at the 5' and 3' ends of Alu segments. It was used with 2F5 template to amplify human unique sequences. (Updates on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                         Example; Page 32; 64pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA sequence of myotonic dystrophy gene - used to produce probes identify CHR 19 abnormality and protein kinase reponsible.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In order to physically map and clone the region of the Wilson's disease (WD) gene, a 4.3kb insert from the WD flanking marker D13S31 (probe pCR13Z4) was used to screen a large insert, CBEH II YAC sublibrary. A higher resolution YAC map was constructed using inner-Alu PCR product from 4 large YAC clones to screen the 1431 colony CEPH I YAC sublibrary. A total of 16 mid-size YACs were identified. The pattern of mid-size YACs detected by each large YAC clone was used to order the smaller YAC clones relative to one another. Inter-Alu PCR "fingerprinting" of YAC clones further assisted the ordering process. The data for this are not given in the publication. (Updated on 25-MAR-2003 to correct PN field.)

A higher resolution YAC map was constructed using inter-Alu PCR product from 4 large YAC clones to screen the 1431 colony CEPH I YAC sublibrary. A total of 16 mid-size YACs were identified. The pattern of mid-size YACs detected by each large YAC clone was used to order the smaller YAC clones relative to one another. Inter-Alu PCR "fingerprinting" of YAC clones further assisted the ordering process. The data for this are not given in the publication. (Updated on 25-MAR-2003 to correct PN field.)
                        The consensus sequence, from bases 13-31, of the 5' end of a 300 bp Alu segment. The sequence was used to generate a set of primers, designated Alu-1 primers set (AAQ76247). The primers of the set have a reverse complementary sequence to the Alu consensus sequence. Thus priming with the Alu-1 set directs synthesis towards the 5' end (1.e. away from the middle) of the Alu segment. Since the primer set is designed to bind close to the edge of an Alu segment, amplification with these primers will reduce the amount of Alu segment sequence and increase the amount o specific chromosomal DNA present required for probe production. The primer set is useful in the production of chromosomal specific probes esfor the detection of chromosomal breakpoints and rearrangements such as probe to detect chronic myelogenous leukemia characterised by the philadelphia chromosome, arising from a reciprocal translocation t (9;22)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAQ76249 standard; DNA; 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19

                                                                                                                                                                                                               The generic sequence of a primer set designated Alu-1. The primer set was based on bases 13-31 of the 5' end of a 300 bp Alu segment (AAQ76249). The primers of the set have a reverse complementary sequence to the Alu consensus sequence. Thus priming with the Alu-1 set directs synthesis cowards the 5' end (i.e. away from the middle) of the Alu segment. Since the primer set is designed to bind close to the edge of an Alu segment, amplification with these primers will reduce the amount of Alu segment sequence and increase the amount of specific chromosomal DNA present required for probe production. The primer set is useful in the production of chromosomal specific probes e.g for the detection of chromosomal breakpoints and rearrangements such as a probe to detect chronic myelogenous leukemia characterised by the Philadelphia chromosome, arising from a reciprocal translocation t(9;22) (q34;q11).                                                                                                                                                                                                                                                 CC produce yeast artificial chromosome (YAC) probes. The YAC probes are used to isolate the nucleic acid sequences of the invention. The specification concluding a necessary sequences derived from a eukaryotic chromosome, are able, in a compatible cell, of replicating acting acting a extractic chromosomal element and segregating during cell division. The sequences concluding a necessary sequences for use in gene therapy, comprising a replicable, segregating during cell division. The sequences can be used to construct artificial chromosomes for use in gene therapy, comprising a replicable, segregating nucleic acid that confers a specific phenotype on cells. Human artificial chromosomes can propagate in human cells and carry large amounts of DNA (e.g. therapeutic genes), and, being extra-chromosomal, they are not mutagenic. The artificial chromosomes are consuction of proteins and to make diagnostic resgents, end. Despression of cytokines, receptors and growth factors, or to increase the copy number of a gene in a cell. The constructs may also be used for functional and structural analysis of chromosomes
                                                                                                                                                  Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of primer Mchx-pr1, which is based on a 3' sequence of human EST clone 427786. This clone had been isolated during a database screening for sequences having homology to the FADD-like caspases Mch4 (caspase-10) and MchS/MACH/FLICE. Mchx-pr1 was used with primer Mchx-pr3 (see AAV74140) in a primary PCR of cDNA from a Jurkat cell library. A secondary PCR was performed using primers Mchx-pr2 and Mchx-pr4 (see AAV74141-42). The PCR product was cloned into vector pBluescript II KS+ and used to screen the Jurkat cDNA library. The beta-isoform of FLAME-1 was isolated. This probe was used to isolate a full-length cDNA (see AAV74136) encoding human FLAME-1 (see AAV90107), a novel anti-apoptotic protein useful for developing apoptotic and anti-apoptotic agents for treating e.g. HIV infection, Alzheimer's disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated FADD-like anti-apoptotic molecules -apoptotic and anti-apoptotic agents for treating, Alzheimer's disease or neoplastic conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of primer Mchx-pr2, which is based on a 3' sequence of human EST clone 427786. This clone had been isolated during a database screening for sequences having homology to the FADD-like caspases Mch4 (caspase-10) and Mch5/MACH/FILCE. Mchx-pr2 was used with primer Mchx-pr4 (see AAV74142) in a secondary PCR of cDNA from a JURKat cell library. A primary PCR was performed using primers Mchx-pr1 and Mchx-pr3 (see AAV74139-40). The PCR product was cloned into vector pBluescript II KS+ and used to screen the JURKat cDNA library. The beta-isoform of FLAME-1 was isolated. This probe was used to isolate a full-length cDNA (see AAV74136) encoding human FLAME-1 (see AAM79107), a novel anti-apoptotic protein useful for developing apoptotic and anti-apoptotic agents for treating e.g. HIV infection, Alzheimer's disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated FADD-like anti-apoptotic molecules -apoptotic and anti-apoptotic agents for treating, Alzheimer's disease or neoplastic conditions.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPS. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleix acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (transcriptional activator). The antisense compounds are useful as research agents and diagnostics such as in the elucidation of the function of a particular gene. The antisense compounds can be useful as therapeutic modalities that can be configured to be useful in treatment regimes for treatment of cells, tissues and animals, especially humans. In the prior art, there are no known therapeutic agents which effectively inhibit the synthesis of CREL and additional agents capable of inhibiting CREL function are still required. Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to

Claim 1; Page 59; 83pp; English

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc acid sample.

in a nucleic

Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscullar dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammattion, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular trophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscul dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FLAME-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-OCT-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
The invention relates to FADD-like apoptotic/anti-apoptotic proteins (FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzheimer's disease. FLAME inhibitors are useful as apoptotic agents and activators are useful as anti-apoptotic agents. FLAME-1 is useful as a substrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1 specific PCR primer, used in the
                                                                                                                                                                                                                                                                                            Novel FADD-like apoptotic/anti-apoptotic proteins useful for inhibiting apoptosis, treating diseases characterized by apoptosis e.g. HIV infection and Alzheimer's disease, and for identifying modulators of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US2002086983-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human FLAME-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-NOV-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18 BP; 3
                                                                                                          The invention relates to FADD-like apoptotic/anti-apoptotic proteins (FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzheimer's disease. FLAME inhibitors are useful as apoptotic agents activators are useful as anti-apoptotic agents. FLAME-1 is useful as substrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1 specific PCR primer, used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-NOV-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    acids and encoded proteins thereof. Specifically, it refers to certain members of the VR family that are involved in pain perception, in particular, TRPV3 (previously knows KNLS, VRLX, VR4 & TRPV7), TRPV4 (previously known as VRL3 & OTRPC4) and TRPM8 (previously known as TRPX). Furthermore, this invention includes trkh+ pain specific genes expressed in the sensory neurons of the dorsal root ganglia. Accordingly, such compositions can be useful for the diagnosis, treatment and prevention of pain, inflammation, skin disorders and cancer, and so exhibit analgesic, antiinflammatory, dermatological and cytostatic activities. This oligonucleotide sequence is a PCR primer used to amplify the murine TRPV3
                                                                 ADH59598
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated TRPV3, TRPV4 or TRPM8 vanilloid receptor nucleic acid molecule and polypeptides, useful for the diagnosis and treatment of disorders such as pain, inflammation, skin diseases and cancer.

Comprises contacting the sample with the mixture of probes (preferably comprises contacting the sample with the mixture of probes (preferably comprises contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or comore detectable nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid and control genomic nucleic acid and the array or both the sample and control genomic nucleic acid and contacting the array with treated mixture of sample and control genomic nucleic acid and contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the control. The hybridization of the genomic conditions, and comparing the probes to genomic nucleic acid, thus determining the promote nucleic acid hybrid. The sample as compared with the relative copy numbers of substantially corrected to sample as compared with the relative copy numbers of substantially corrected genomic nucleic acid hybrid. The hybridization of the genomic nucleic acid hybrid. The sample acid are labelled with detectable moiety such that hybridization of the genomic nucleic acid to be tested and the reference of nucleic acid and the reference of nucleic acid that is prepared from the one or more genomic nucleic 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic accupables, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an ass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 10; SEQ ID NO 4; 103pp; English.

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic

Claim 10; SEQ ID NO 16; 103pp; English

CC more detectable nucleic acid probes to the target genomic nucleic acid of the sample by determining the hybridization of the one or common the control sample. The genomic nucleic acid is contained in a fixed tissue or a ccell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The ccell of a control sample using a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid and the array to contacting the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the control. The hybridization of the genomic nucleic acid, thus compared with the relative copy numbers of substantially contacting the control sequences in the control. The hybridization of the genomic conditions, and comparing the control sequences in the control. The hybridization of the genomic of the genomic of the genomic array is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid, thus detectable antibody. The sample of genomic array is determined by determining the presence, absence, amount or location of the detectable moiety such that hybridization of the detectable useful for suppressing the binding of one or more detectable nucleic probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an after determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferable comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic The present sequence represents a non-nucleotide probe. The probe is probes (preferably the one or more derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                        The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     arrays. The genomic array comprises nucleic acid that is prepared from Bacterial Artificial Chromosome (BAC) clones. The present sequence
                                                                                                                                                                                                                                                                                 Novel neural thread protein peptide, referred as cell death peptide, useful for treating prostatic hyperplasia, psoriasis, eczema, dermatos atherosclerosis, cosmetic modification to skin, throat, mouth, muscle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-JUL-2001; 2001US-0306150P.

                                                                                                                                                                                                                                                         The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC identity of a SNP and for genotyping nucleic acid sample by coligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by cassess by association analysis the genotype of an individual or group of casses by association analysis the genotype of an individual or group of casses by one or more SNPs. Phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC diseases imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC diseases, including, rheumatoid arthritis, multiple sclerosis, pathogenic conformation. The method is also useful in forencic investigations and conformation and conformation in also useful in forencic investigations and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human inflammatory bowel disease associated polymorphic site #167
                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for detecting the presence polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to the presence of genetic polymorphisms associated with inflammatory because and correlating their occurrence with disease states. They method the presence of genetic polymorphisms associated with inflammatory because and correlating their occurrence with disease states.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents the Forward PCR primer, used in expression analysis of human secreted protein, POLYS. POLYX nucleic acids, polypeptides and antibodies to POLYX can be used for treating or preventing a POLYX associated disorder in a subject, preferably a human. These can be used in the manufacture of a medicament for treating a syndrome associated with a human disease selected from a POLYX associated disorder, where the therapeutic is a POLYX polypeptide, a POLYX nucleotide or a POLYX antibody. They may also be used to screen for a mucleotide or a POLYX antibody. They may also be used to screen for a
                                             Determining a genotype associated with increased or decreased resistance to familial bipolar affective disorder in a family comprises determining the genotype of e.g., chromosomal regions D4S402 and D4S424.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; genotype determination; familial bipolar affective disorder; chromosomal region linked; locus associated with resistance; D4S402 D4S424; D4S431; D4S404; D1IS394; D1IS39; chromosome marker; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   XAAAAAAAAAAAAAAAAAAAAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of determining a genotype cassociated with increased or decreased resistance to familial bipolar caffective disorder. The method comprises determining the genotype with at cleast one marker of at least one chromosomal region linked to a locus corromosomal regions are included of and localised between D49402 and C4 chromosomal regions are included of and localised between D49402 and C4 chromosomal regions are included of and localised between D49402 and C5 chromosomal regions or D18394 and D1829. The invention also consider that for determining a genotype associated with increased or discloses a kit for determining a genotype associated with increased or correased resistance to familial bipolar affective disorder, where the ckit comprises markers for two or more of the chromosomal regions cited. The method and kit are useful for determining a genotype associated with increased or decreased resistance to familial bipolar affective disorder cin a family affected by bipolar affective disorder, for determining the contribution of these chromosomal regions to bipolar affective disorder in a affective family member, and for assessing an increased or correspond risk of developing bipolar illness for a tested individual from correspond invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
The invention relates to human POLYX polypeptides and the polynucleotides concoding them. The invention also relates to an antibody that cimmunospecifically binds to a POLYX polypeptide, a method of determining the presence or amount of a POLYX polypucleotide in a sample involving contacting the presence or amount of the probe bound to the polynucleotide and comethod of identifying an agent that modulates the expression or activity of a POLYX polypeptide involving providing a cell expression or activity complete involving providing a cell expression or activity of a POLYX polypeptide involving providing a cell expression where an agent modulates expression or activity of the polypeptide where an agent modulates expression or activity of the polypeptide where an activation, and a method of modulating the activity of a polypeptide compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound that binds to the polypeptide in an amount sufficient to compound the activity. The POLYX polypeptides are useful for contacting the presence of or predisposition to a disease associated with altered levels of POLYX DNA or protein in a first mammalian subject, involving measuring the level of expression of DNA or the amount of protein in a sample from the first mammalian subject and comparing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                         amount of DNA or protein in a sample from a second mammalian subject known not to have or not be predisposed to the disease, where an alteration in the expression level of DNA or protein in the first subject as compared to the control sample indicates the presence of a predisposition to the disease. The sequences of the invention are useful for treating or preventing a POLYX-associated disorder which involves administering POLYX DNA. A therapeutic such as a POLYX DNA, protein or antibody is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. This sequence represents a PCR primer used to amplify a human POLYX polynucleotide of the invention.

detecting Detecting gene polymorphism in interleukin-18 adult onset still disease. gene of human, useful

WPI; 2004-174121/17

Claim 6; SEQ ID NO 6; 61pp; Japanese.

The invention relates to a novel method for detecting a gene polymorphism in a human interleukin (II)-18 gene. The method involves detecting a 9 base insertion between -6311 position and -6310 position, a polymorphism at positions -5890, -5316, -4762, -4675, -3268, -689 and -640 of a polymuclectide which consists of a fully defined sequence of 6640 base pairs as given in the specification, where in the 6640bp polymuclectide, the position 6575 is set to +1 from which numbering is performed. The method is useful for detecting gene polymorphism in II-18 gene of human and for detecting adult onset still disease. This polymuclectide sequence represents a primer of the human interleukin-18 gene of the invention.

Sequence 19 BP; 4 A; 3 C; 7 G; 5 T; 0 U; 0 Other;
